# Hyponormal Toeplitz Operators with Matrix-Valued Circulant Symbols 

In Sung Hwang, Dong-O Kang and Woo Young Lee

#### Abstract

In this paper we are concerned with the hyponormality of Toeplitz operators with matrix-valued circulant symbols. We establish a necessary and sufficient condition for Toeplitz operators with matrix-valued partially circulant symbols to be hyponormal and also provide a rank formula for the self-commutator.

Keywords. Block Toeplitz operators, matrix-valued symbols, bounded type functions, circulant functions, hyponormal.

## 1. Introduction

Throughout this paper, let $\mathcal{H}$ denote a separable complex Hilbert space and $\mathcal{B}(\mathcal{H})$ denote the set of all bounded linear operators acting on $\mathcal{H}$. For an operator $T \in \mathcal{B}(\mathcal{H}), T^{*}$ denotes the adjoint of $T$. An operator $T \in \mathcal{B}(\mathcal{H})$ is said to be normal if $T^{*} T=T T^{*}$, unitary if $T^{*} T=T T^{*}=I$, hyponormal if its self-commutator $\left[T^{*}, T\right] \equiv T^{*} T-T T^{*}$ is positive semi-definite, and subnormal if $T$ has a normal extension $N$, i.e., there is a Hilbert space $\mathcal{K}$ containing $\mathcal{H}$ and a normal operator $N$ on $\mathcal{K}$ such that $N \mathcal{H} \subseteq \mathcal{H}$ and $T=\left.N\right|_{\mathcal{H}}$. For an operator $T \in \mathcal{B}(\mathcal{H})$, we write $\operatorname{ker} T$ and $\operatorname{ran} T$ for the kernel and the range of $T$, respectively. For a set $\mathcal{M}, \operatorname{cl} \mathcal{M}$ and $\mathcal{M}^{\perp}$ denote the closure and the orthogonal complement of $\mathcal{M}$, respectively.

We review a few essential facts for (block) Toeplitz operators and (block) Hankel operators that we will need to begin with, using [Do1], [Do2], [GGK], [Ni], and [Pe]. Let $L^{2} \equiv L^{2}(\mathbb{T})$ be the set of all square-integrable measurable functions on the unit circle $\mathbb{T} \equiv \partial \mathbb{D}$ in the complex plane and $H^{2} \equiv H^{2}(\mathbb{T})$ be the corresponding Hardy space. Let $H^{\infty} \equiv H^{\infty}(\mathbb{T}):=L^{\infty}(\mathbb{T}) \cap H^{2}(\mathbb{T})$, that is, $H^{\infty}$ is the set of bounded analytic functions on $\mathbb{D}$. Given $\varphi \in L^{\infty} \equiv L^{\infty}(\mathbb{T})$, the Toeplitz operator $T_{\varphi}$ and the Hankel operator $H_{\varphi}$ are defined by

$$
T_{\varphi} g:=P(\varphi g) \quad \text { and } \quad H_{\varphi} g:=J P^{\perp}(\varphi g) \quad\left(g \in H^{2}\right)
$$

where $P$ and $P^{\perp}$ denote the orthogonal projections that map from $L^{2}$ onto $H^{2}$ and $\left(H^{2}\right)^{\perp}$, respectively, and $J$ denotes the unitary operator on $L^{2}$ defined by $J(f)(z)=\bar{z} f(\bar{z})$.

Normal Toeplitz operators were characterized by a property of their symbols in the early 1960's by A. Brown and P.R. Halmos [BH] and the hyponormality of Toeplitz operators was completely solved in terms of their symbols by C. Cowen [Co2] in 1988.

Cowen's Theorem ([Co2], [NT]) For $\varphi \in L^{\infty}$, write

$$
\mathcal{E}(\varphi):=\left\{k \in H^{\infty}:\|k\|_{\infty} \leq 1 \text { and } \varphi-k \bar{\varphi} \in H^{\infty}\right\} .
$$

Then $T_{\varphi}$ is hyponormal if and only if $\mathcal{E}(\varphi)$ is nonempty.

[^0]The elegant and useful theorem of C. Cowen is to recast the operator-theoretic problem of hyponormality for Toeplitz operators into the problem of finding a solution to a certain functional equation involving the operator's symbol. Tractable and explicit criteria for the hyponormality of Toeplitz operators $T_{\varphi}$ with scalar-valued trigonometric polynomials or rational symbols $\varphi$ were established by many authors (cf. [Co1], [Co2], [CL], [FL1], [Gu], [GS], [HK], [HKL1], [HKL2], [HL1], [HL2], [HL3], [Le], [NT], [Zhu], and etc.). When we study hyponormality (also, normality and subnormality) of the Toeplitz operator $T_{\varphi}$ with symbol $\varphi$ we may, without loss of generality, assume that $\varphi(0)=0$ because the hyponormality of an operator is invariant under translation by scalars. We recall that a function $\varphi \in L^{\infty}$ is said to be of bounded type (or in the Nevanlinna class) if there are analytic functions $\psi_{1}, \psi_{2} \in H^{\infty}(\mathbb{D})$ such that

$$
\varphi(z)=\frac{\psi_{1}(z)}{\psi_{2}(z)} \quad \text { for almost all } z \in \mathbb{T}
$$

We write, for an inner function $\theta$,

$$
\mathcal{H}(\theta):=H^{2} \ominus \theta H^{2} .
$$

It was known [Ab, Lemma 3] that if $\varphi \in H^{2}$ is such that $\bar{\varphi}$ is of bounded type and $\varphi(0)=0$ then we can write

$$
\begin{equation*}
\varphi=\theta \bar{b}, \tag{1.1}
\end{equation*}
$$

where $\theta$ is an inner function and $b \in \mathcal{H}(\theta)$ satisfies that $b$ and $\theta$ are coprime. If $\varphi$ is a rational function then by Kronecker's Lemma [Ni, p.183], $\theta$ in (1.1) can be chosen as a finite Blaschke product. It was also [Ab, Lemma 6] known that if $T_{\varphi}$ is hyponormal, if $\varphi \notin H^{\infty}$, and if $\varphi$ or $\bar{\varphi}$ is of bounded type then both $\varphi$ and $\bar{\varphi}$ are of bounded type.

We now introduce the notion of block Toeplitz and block Hankel operators. Let $M_{n}$ denote the set of $n \times n$ complex matrices. For a complex Hilbert space $\mathcal{X}$, let $L_{\mathcal{X}}^{2} \equiv L_{\mathcal{X}}^{2}(\mathbb{T})$ be the Hilbert space of $\mathcal{X}$-valued norm square-integrable measurable functions on $\mathbb{T}$ and $H_{\mathcal{X}}^{2} \equiv H_{\mathcal{X}}^{2}(\mathbb{T})$ be the corresponding Hardy space. We observe that $L_{\mathbb{C}^{n}}^{2}=L^{2}(\mathbb{T}) \otimes \mathbb{C}^{n}$ and $H_{\mathbb{C}^{n}}^{2}=H^{2}(\mathbb{T}) \otimes \mathbb{C}^{n}$. If $\Phi$ is a matrix-valued function in $L_{M_{n}}^{\infty} \equiv L_{M_{n}}^{\infty}(\mathbb{T})\left(=L^{\infty}(\mathbb{T}) \otimes M_{n}\right)$ then the block Toeplitz operator $T_{\Phi}$ and the block Hankel operator $H_{\Phi}$ on $H_{\mathbb{C}^{n}}^{2}$ are defined by

$$
T_{\Phi} f=P_{n}(\Phi f) \quad \text { and } \quad H_{\Phi} f=J P_{n}^{\perp}(\Phi f) \quad\left(f \in H_{\mathbb{C}^{n}}^{2}\right),
$$

where $P_{n}$ and $P_{n}^{\perp}$ denote the orthogonal projections that map from $L_{\mathbb{C}^{n}}^{2}$ onto $H_{\mathbb{C}^{n}}^{2}$ and $\left(H_{\mathbb{C}^{n}}^{2}\right)^{\perp}$, respectively and $J$ denotes the unitary operator on $L_{\mathbb{C}^{n}}^{2}$ given by $J(g)(z)=\bar{z} I_{n} g(\bar{z})$ for $g \in L_{\mathbb{C}^{n}}^{2}$ ( $I_{n}:=$ the $n \times n$ identity matrix). For $\Phi \in L_{M_{n}}^{\infty}$, write

$$
\begin{equation*}
\widetilde{\Phi}(z):=\Phi^{*}(\bar{z}) \tag{1.2}
\end{equation*}
$$

An inner (matrix) function $\Theta \in H_{M_{n \times m}}^{\infty}\left(=H^{\infty} \otimes M_{n \times m}\right)$ is one satisfying $\Theta^{*} \Theta=I_{m}$ for almost all $z \in \mathbb{T}$, where $M_{n \times m}$ denotes the set of $n \times m$ complex matrices. The following basic relations can be easily derived:
(1.3) $T_{\Phi}^{*}=T_{\Phi^{*}}, H_{\Phi}^{*}=H_{\widetilde{\Phi}} \quad\left(\Phi \in L_{M_{n}}^{\infty}\right)$;
(1.4) $T_{\Phi \Psi}-T_{\Phi} T_{\Psi}=H_{\Phi^{*}}^{*} H_{\Psi} \quad\left(\Phi, \Psi \in L_{M_{n}}^{\infty}\right)$;
(1.5) $\quad H_{\Phi} T_{\Psi}=H_{\Phi \Psi}, H_{\Psi \Phi}=T_{\widetilde{\Psi}}^{*} H_{\Phi} \quad\left(\Phi \in L_{M_{n}}^{\infty}, \Psi \in H_{M_{n}}^{\infty}\right)$;
(1.6) $\quad H_{\Phi}^{*} H_{\Phi}-H_{\Theta \Phi}^{*} H_{\Theta \Phi}=H_{\Phi}^{*} H_{\Theta^{*}} H_{\Theta^{*}}^{*} H_{\Phi} \quad\left(\Theta \in H_{M_{n}}^{\infty}\right.$ is inner, $\left.\Phi \in L_{M_{n}}^{\infty}\right)$.

For a matrix-valued function $\Phi=\left[\varphi_{i j}\right] \in L_{M_{n}}^{\infty}$, we say that $\Phi$ is of bounded type if each entry $\varphi_{i j}$ is of bounded type and that $\Phi$ is rational if each entry $\varphi_{i j}$ is a rational function. A matrix-valued trigonometric polynomial $\Phi \in L_{M_{n}}^{\infty}$ is of the form

$$
\Phi(z)=\sum_{j=-m}^{N} A_{j} z^{j}\left(A_{j} \in M_{n}\right)
$$

where $A_{N}$ and $A_{-m}$ are called the outer coefficients of $\Phi$.

For matrix-valued functions $A(z)=\sum_{j=-\infty}^{\infty} A_{j} z^{j} \in L_{M_{n}}^{2}$ and $B(z)=\sum_{j=-\infty}^{\infty} B_{j} z^{j} \in L_{M_{n}}^{2}$, we define the inner product of $A$ and $B$ by

$$
(A, B):=\int_{\mathbb{T}} \operatorname{tr}\left(B^{*} A\right) d \mu=\sum_{j=-\infty}^{\infty} \operatorname{tr}\left(B_{j}^{*} A_{j}\right)
$$

where $\operatorname{tr}(\cdot)$ means the trace of the matrix and define $\|A\|_{2}:=(A, A)^{\frac{1}{2}}$. We also define, for $A \in L_{M_{n}}^{\infty}$,

$$
\|A\|_{\infty}:=\operatorname{ess} \sup _{t \in \mathbb{T}}\|A(t)\| \quad(\|\cdot\| \text { means the spectral norm of the matrix })
$$

The following fundamental result is known as the Beurling-Lax-Halmos Theorem (cf. [FF], $[\mathrm{Ni}]$ ), which will be useful in the sequel.

The Beurling-Lax-Halmos Theorem. A nonzero subspace $M$ of $H_{\mathbb{C}^{n}}^{2}$ is invariant for the shift operator $S \equiv T_{z I_{n}}$ on $H_{\mathbb{C}^{n}}^{2}$ (i.e., $S(M) \subset M$ ) if and only if $M=\Theta H_{\mathbb{C}^{m}}^{2}$, where $\Theta$ is an inner matrix function in $H_{M_{n \times m}}^{\infty}(m \leq n)$.

From (1.5) we can see that the kernel of a block Hankel operator $H_{\Phi}$ is an invariant subspace of the shift operator on $H_{\mathbb{C}^{n}}^{2}$. Thus, if $\operatorname{ker} H_{\Phi} \neq\{0\}$, then by the Beurling-Lax-Halmos theorem,

$$
\operatorname{ker} H_{\Phi}=\Theta H_{\mathbb{C}^{m}}^{2}
$$

for some inner matrix function $\Theta$. In general, $\Theta$ need not be square. We note that if $\Theta \in H_{M_{n}}^{\infty}$ is an inner matrix function then ker $H_{\Theta^{*}}=\Theta H_{\mathbb{C}^{n}}^{2}$.

Recently, Gu, Hendricks and Rutherford [GHR] characterized the hyponormality of block Toeplitz operators in terms of their symbols. In particular they showed that if $T_{\Phi}$ is a hyponormal block Toeplitz operator on $H_{\mathbb{C}^{n}}^{2}$, then $\Phi$ is normal, i.e., $\Phi^{*} \Phi=\Phi \Phi^{*}$. Their characterization for hyponormality of block Toeplitz operators resembles the Cowen's theorem except for an additional condition - the normality of the symbol.

Lemma 1.1. (Hyponormality of Block Toeplitz Operators) [GHR] For each $\Phi \in L_{M_{n}}^{\infty}$, let

$$
\mathcal{E}(\Phi):=\left\{K \in H_{M_{n}}^{\infty}:\|K\|_{\infty} \leq 1 \text { and } \Phi-K \Phi^{*} \in H_{M_{n}}^{\infty}\right\}
$$

Then $T_{\Phi}$ is hyponormal if and only if $\Phi$ is normal and $\mathcal{E}(\Phi)$ is nonempty.
However, as in the scalar-valued cases, the case of arbitrary matrix-valued symbol $\Phi \in L_{M_{n}}^{\infty}$, though solved by Lemma 1.1, is in practice very difficult. In [GHR] it was shown that, as in the scalar-valued case, if $\Phi$ is a matrix-valued trigonometric polynomial with an invertible analytic outer coefficient then the hyponormality of $T_{\Phi}$ can be determined by a matrix-valued Carathéodory interpolation problem. In [HL4] and [HL5], it was shown that if $\Phi \in L_{M_{n}}^{\infty}$ is a matrix-valued rational function then the hyponormality of the block Toeplitz operator $T_{\Phi}$ can be determined by the matrix-valued tangential or classical Hermite-Fejér interpolation problem.

For a matrix-valued function $\Phi \in H_{M_{n \times r}}^{2}$, we say that $\Delta \in H_{M_{n \times m}}^{2}$ is a left inner divisor of $\Phi$ if $\Delta$ is an inner matrix function such that $\Phi=\Delta A$ for some $A \in H_{M_{m \times r}}^{2}(m \leq n)$. We also say that two matrix functions $\Phi \in H_{M_{n \times r}}^{2}$ and $\Psi \in H_{M_{n \times m}}^{2}$ are left coprime if the only common left inner divisor of both $\Phi$ and $\Psi$ is a unitary constant and that $\Phi \in H_{M_{n \times r}}^{2}$ and $\Psi \in H_{M_{m \times r}}^{2}$ are right coprime if $\widetilde{\Phi}$ and $\widetilde{\Psi}$ are left coprime. Two matrix functions $\Phi$ and $\Psi$ in $H_{M_{n}}^{2}$ are said to be coprime if they are both left and right coprime. We remark that if $\Phi \in H_{M_{n}}^{2}$ is such that $\operatorname{det} \Phi$ is not identically zero then any left inner divisor $\Delta$ of $\Phi$ is square, i.e., $\Delta \in H_{M_{n}}^{2}$. If $\Phi \in H_{M_{n}}^{2}$ is such that $\operatorname{det} \Phi$ is not identically zero then we say that $\Delta \in H_{M_{n}}^{2}$ is a right inner divisor of $\Phi$ if $\widetilde{\Delta}$ is a left inner divisor of $\widetilde{\Phi}$.

On the other hand, in the preceding, we have remarked that $\Theta$ need not be square in the equality $\operatorname{ker} H_{\Phi}=\Theta H_{\mathbb{C}^{n}}^{2}$. But it was known [GHR] that for $\Phi \in L_{M_{n}}^{\infty}$, the following statements are equivalent:
(i) $\Phi$ is of bounded type;
(ii) $\operatorname{ker} H_{\Phi}=\Theta H_{\mathbb{C}^{n}}^{2}$ for some square inner matrix function $\Theta$;
(iii) $\Phi=A \Theta^{*}$, where $A \in H_{M_{n}}^{\infty}$ and $A$ and $\Theta$ are right coprime.

For $\Phi \in L_{M_{n}}^{\infty}$ we write

$$
\Phi_{+}:=P_{n} \Phi \in H_{M_{n}}^{2} \quad \text { and } \quad \Phi_{-}:=\left(P_{n}^{\perp} \Phi\right)^{*} \in H_{M_{n}}^{2}
$$

where $P_{n}$ denotes the orthogonal projection from $L_{M_{n}}^{2}$ onto $H_{M_{n}}^{2}$. Thus we can write $\Phi=\Phi_{-}^{*}+\Phi_{+}$. Suppose $\Phi_{+}=\left[\varphi_{i j}\right] \in H_{M_{n}}^{2}$ is such that $\Phi^{*}$ is of bounded type. Then we may write $\varphi_{i j}=\theta_{i j} \overline{b_{i j}}$, where $\theta_{i j}$ is an inner function and $\theta_{i j}$ and $b_{i j}$ are coprime. Thus if $\theta$ is the least common multiple of $\theta_{i j}$ 's then we can write

$$
\begin{equation*}
\Phi_{+}=\left[\varphi_{i j}\right]=\left[\theta_{i j} \overline{b_{i j}}\right]=\left[\theta \overline{a_{i j}}\right]=\Theta A^{*} \quad\left(\Theta=\theta I_{n}, A \in H_{M_{n}}^{2}\right) \tag{1.7}
\end{equation*}
$$

For brevity, we write $I$ for the identity matrix and

$$
I_{\zeta}:=\zeta I \quad\left(\zeta \in L^{\infty}\right)
$$

For an inner matrix function $\Theta \in H_{M_{n}}^{2}$, we write

$$
\mathcal{H}(\Theta):=H_{\mathbb{C}^{n}}^{2} \ominus \Theta H_{\mathbb{C}^{n}}^{2}, \quad \mathcal{H}_{\Theta}:=H_{M_{n}}^{2} \ominus \Theta H_{M_{n}}^{2} \quad \text { and } \quad \mathcal{K}_{\Theta}:=H_{M_{n}}^{2} \ominus H_{M_{n}}^{2} \Theta
$$

Let $\Phi \equiv \Phi_{-}^{*}+\Phi_{+} \in L_{M_{n}}^{\infty}$ be such that $\Phi$ and $\Phi^{*}$ are of bounded type. Then in view of (1.7) we can write

$$
\begin{equation*}
\Phi_{+}=\Theta_{1} A^{*} \quad \text { and } \quad \Phi_{-}=\Theta_{2} B^{*} \tag{1.8}
\end{equation*}
$$

where $\Theta_{i}=I_{\theta_{i}}$ with an inner function $\theta_{i}(i=1,2), A \in \mathcal{K}_{I_{z} \Theta_{1}}$ and $B \in \mathcal{K}_{\Theta_{2}}$. In particular, if $\Phi \in L_{M_{n}}^{\infty}$ is rational then the $\theta_{i}$ are chosen as finite Blaschke products as we observed in (1.1).

Before we proceed we remark that by contrast to the scalar-valued case, $\Phi^{*}$ may not be of bounded type even though $T_{\Phi}$ is hyponormal, $\Phi \notin H_{M_{n}}^{\infty}$ and $\Phi$ is of bounded type. But we have one-way implication: if $T_{\Phi}$ is hyponormal and $\Phi^{*}$ is of bounded type then $\Phi$ is also of bounded type (see [GHR]). Thus whenever we deal with hyponormal Toeplitz operators $T_{\Phi}$ with symbols $\Phi$ satisfying that both $\Phi$ and $\Phi^{*}$ are of bounded type, it suffices to assume that only $\Phi^{*}$ is of bounded type.

In this paper we are concerned with the hyponormality of Toeplitz operators with matrixvalued circulant symbols. In Section 2, we provide some auxiliary lemmas. In Section 3, we prove the main result which gives a necessary and sufficient condition for Toeplitz operators with matrixvalued partially circulant symbols to be hyponormal and also provide a rank formula for the self-commutator.

## 2. Auxiliary lemmas

If $\Omega$ is the greatest common left inner divisor of $A$ and $\Theta$ in the representation (1.7):

$$
\Phi=\Theta A^{*}=A^{*} \Theta \quad\left(\Theta \equiv I_{\theta} \text { for an inner function } \theta\right)
$$

then $\Theta=\Omega \Omega_{l}$ and $A=\Omega A_{l}$ for some inner matrix $\Omega_{l}$ (where $\Omega_{l} \in H_{M_{n}}^{2}$ because $\operatorname{det} \Theta$ is not identically zero) and some $A_{l} \in H_{M_{n}}^{2}$. Therefore if $\Phi^{*} \in L_{M_{n}}^{\infty}$ is of bounded type then we can write

$$
\Phi=A_{l}{ }^{*} \Omega_{l}, \quad \text { where } A_{l} \text { and } \Omega_{l} \text { are left coprime: }
$$

in this case, $A_{l}^{*} \Omega_{l}$ is called the left coprime decomposition of $\Phi$ and similarly, we can write

$$
\Phi=\Omega_{r} A_{r}^{*}, \quad \text { where } A_{r} \text { and } \Omega_{r} \text { are right coprime }\left(\Omega_{l} \in H_{M_{n}}^{2}\right):
$$

in this case, $\Omega_{r} A_{r}^{*}$ is called the right coprime decomposition of $\Phi$.

In general, it is not easy to check the condition " $\Theta$ and $A$ are right coprime" for the representation $\Phi=\Theta A^{*}\left(\Theta\right.$ is inner and $\left.A \in H_{M_{n}}^{2}\right)$ even though $\Theta=I_{\theta}$ for an inner function $\theta$. But if $\theta$ is a finite Blaschke product then we have a more tractable criterion.

Lemma 2.1. If $A, \Theta \in H_{M_{n}}^{\infty}\left(\Theta:=I_{\theta}\right.$ with a finite Blaschke product $\left.\theta\right)$ then the following are equivalent:
(a) $A(\alpha)$ is invertible for each zero $\alpha$ of $\theta$;
(b) A and $\Theta$ are right coprime;
(c) A and $\Theta$ are left coprime.

Remark. Lemma 2.1 extends Lemma 3.10 of [CHL], in which the same result was proved when $A \in H_{M_{n}}^{\infty}$ is rational.

Proof. (a) $\Rightarrow(\mathrm{b})$ : Suppose $A(\alpha)$ is invertible for each zero $\alpha$ of $\theta$. Observe that

$$
\mathfrak{h} \in \operatorname{ker} H_{A \Theta^{*}} \Longleftrightarrow A \Theta^{*} \mathfrak{h} \in \Theta H_{\mathbb{C}^{n}}^{2} \Longleftrightarrow A \mathfrak{h} \in \Theta H_{\mathbb{C}^{n}}^{2}
$$

Let $\theta$ be a finite Blaschke product of degree $d$. Then we can write

$$
\theta(z)=e^{i \xi} \prod_{i=1}^{N}\left(\frac{z-\alpha_{i}}{1-\overline{\alpha_{i}} z}\right)^{m_{i}}
$$

where $\sum_{i=1}^{N} m_{i}=d$. Thus $\mathfrak{h} \in \operatorname{ker} H_{A \Theta^{*}}$ if and only if for each $i=1,2, \cdots, N$

$$
\left[\begin{array}{cccccc}
A_{i, 0} & 0 & 0 & 0 & \ldots & 0 \\
A_{i, 1} & A_{i, 0} & 0 & 0 & \ldots & 0 \\
A_{i, 2} & A_{i, 1} & A_{i, 0} & 0 & \ldots & 0 \\
\vdots & \ddots & \ddots & \ddots & \ddots & \vdots \\
& & \ddots & \ddots & A_{i, 0} & 0 \\
A_{i, m_{i}-2} & A_{i, m_{i}-3} & \ldots & A_{i, 2} & A_{i, 1} & A_{i, 0}
\end{array}\right]\left[\begin{array}{c}
\mathfrak{h}_{i, 0} \\
A_{i, m_{i}-1}
\end{array} A_{i, m_{i}-2} \quad \ldots \mathfrak{h}_{i, 1}\right]\left[\begin{array}{c}
\mathfrak{h}_{i, 2} \\
\vdots \\
\mathfrak{h}_{i, m_{i}-2} \\
\mathfrak{h}_{i, m_{i}-1}
\end{array}\right]=0,
$$

where

$$
A_{i, j}:=\frac{A^{(j)}\left(\alpha_{i}\right)}{j!} \quad \text { and } \quad \mathfrak{h}_{i, j}:=\frac{\mathfrak{h}^{(j)}\left(\alpha_{i}\right)}{j!} .
$$

Since $A(\alpha)$ is invertible for each zero $\alpha$ of $\theta, A_{i, 0}$ is invertible for each $i=1,2, \cdots, N$. Thus

$$
\mathfrak{h}_{i, j}=0 \quad\left(i=1,2, \cdots, N, j=0,1,2, \cdots, m_{i}-1\right)
$$

which implies that ker $H_{A \Theta^{*}} \subseteq \Theta H_{\mathbb{C}^{n}}^{2}$. But since evidently $\Theta H_{\mathbb{C}^{n}}^{2} \subseteq$ ker $H_{A \Theta^{*}}$, it follows that ker $H_{A \Theta^{*}}=\Theta H_{\mathbb{C}^{n}}^{2}$, which implies that $A$ and $\Theta$ are right coprime.
(b) $\Rightarrow$ (a) and (b) $\Leftrightarrow(\mathrm{c})$ : From the proof of [CHL, Lemma 3.10].

If $\Phi \in L_{M_{n}}^{\infty}$, then by (1.4),

$$
\left[T_{\Phi}^{*}, T_{\Phi}\right]=H_{\Phi^{*}}^{*} H_{\Phi^{*}}-H_{\Phi}^{*} H_{\Phi}+T_{\Phi^{*} \Phi-\Phi \Phi^{*}}
$$

Since the normality of $\Phi$ is a necessary condition for the hyponormality of $T_{\Phi}$, the positivity of $H_{\Phi^{*}}^{*} H_{\Phi^{*}}-H_{\Phi}^{*} H_{\Phi}$ is an essential condition for the hyponormality of $T_{\Phi}$. Thus it is more convenient for the argument of the hyponormality of $T_{\Phi}$ to define the positivity of $H_{\Phi^{*}}^{*} H_{\Phi^{*}}-H_{\Phi}^{*} H_{\Phi}$ as another notion.

Our proof of Lemma 2.1 relies upon interpolation theory. However, we are informed by the referee that the proof of Lemma 2.1 can be simplified with the help of the corona theorem for matrix-valued functions (cf. [Fu], [DD]). The authors are thankful to the referee for the valuable comment.

Definition 2.2. Let $\Phi \in L_{M_{n}}^{\infty}$. The pseudo-selfcommutator of $T_{\Phi}$ is defined by

$$
\left[T_{\Phi}^{*}, T_{\Phi}\right]_{p}:=H_{\Phi^{*}}^{*} H_{\Phi^{*}}-H_{\Phi}^{*} H_{\Phi}
$$

Then $T_{\Phi}$ is said to be pseudo-hyponormal if $\left[T_{\Phi}^{*}, T_{\Phi}\right]_{p}$ is positive semidefinite.
From the definition, we can see that the pseudo-hyponormality of $T_{\Phi}$ is independent of the constant matrix term $\Phi(0)$. Thus whenever we consider the pseudo-hyponormality of $T_{\Phi}$ we may assume that $\Phi(0)=0$. Observe that if $\Phi \in L_{M_{n}}^{\infty}$ then

$$
\left[T_{\Phi}^{*}, T_{\Phi}\right]=\left[T_{\Phi}^{*}, T_{\Phi}\right]_{p}+T_{\Phi^{*} \Phi-\Phi \Phi^{*}}
$$

We thus have
$T_{\Phi}$ is hyponormal $\Longleftrightarrow T_{\Phi}$ is pseudo-hyponormal and $\Phi^{*} \Phi=\Phi \Phi^{*}$, i.e., $\Phi$ is normal and (via Theorem 3.3 of [GHR]) $T_{\Phi}$ is pseudo-hyponormal if and only if $\mathcal{E}(\Phi) \neq \emptyset$.

The following lemma shows that the pseudo-hyponormality of $T_{\Phi}$ with a bounded type symbol $\Phi$ gives a relationship between the analytic and co-analytic parts of the symbol:

Lemma 2.3. Let $\Phi \equiv \Phi_{-}^{*}+\Phi_{+} \in L_{M_{n}}^{\infty}$ be such that $\Phi$ and $\Phi^{*}$ are of bounded type of the form $\Phi_{+}=\Theta_{1} A^{*}$ (right coprime decomposition) and $\Phi_{-}=\Theta_{2} B^{*}$ (right coprime decomposition). If $T_{\Phi}$ is pseudo-hyponormal then $\Theta_{1}=\Theta_{2} \Theta_{0}$ for some inner matrix $\Theta_{0}$.

Proof. Suppose $T_{\Phi}$ is pseudo-hyponormal. Then there exists a matrix function $K \in H_{M_{n}}^{\infty}$ such that $\|K\|_{\infty} \leq 1$ and $\Phi-K \Phi^{*} \in H_{M_{n}}^{\infty}$. Thus $H_{\Phi_{-}^{*}}=H_{K \Phi_{+}^{*}}=T_{\widetilde{K}}^{*} H_{\Phi_{+}^{*}}$, which implies ker $H_{\Phi_{+}^{*}} \subseteq$ ker $H_{\Phi_{-}^{*}}$. Hence $\Theta_{1} H_{\mathbb{C}^{n}}^{2} \subseteq \Theta_{2} H_{\mathbb{C}^{n}}^{2}$ and therefore $\Theta_{2}$ is a left inner divisor of $\Theta_{1}$ (cf. [FF, Corollary IX.2.2]), which gives the result.

In view of Lemma 2.3, when we study the pseudo-hyponormality of block Toeplitz operator $T_{\Phi}$ with symbol $\Phi$ whose adjoint is of bounded type, we may assume that the symbol $\Phi \equiv \Phi_{-}^{*}+\Phi_{+} \in$ $L_{M_{n}}^{\infty}$ is of the form

$$
\Phi_{+}=\Theta \Theta_{1} A^{*} \quad \text { and } \quad \Phi_{-}=\Theta B^{*}
$$

For a closed subspace $\mathcal{X}$ of a Hilbert space $\mathcal{H}$, write $P_{\mathcal{X}}$ for the orthogonal projection from $\mathcal{H}$ onto $\mathcal{X}$.

The following is an elementary observation.
Lemma 2.4. For any inner matrices $\Theta_{1}$ and $\Theta_{2}$ in $H_{M_{n}}^{2}$, we have

$$
\mathcal{K}_{\Theta_{1} \Theta_{2}}=\mathcal{K}_{\Theta_{1}} \Theta_{2}+\mathcal{K}_{\Theta_{2}} .
$$

Proof. For $F \in \mathcal{K}_{\Theta_{1} \Theta_{2}}$, we can write

$$
F=F_{1}+F_{2},
$$

where $F_{1} \in H_{M_{n}}^{2} \Theta_{2}$ and $F_{2}=P_{\mathcal{K}_{\Theta_{2}}} F$. Thus $F_{1}=E \Theta_{2}$ for some $E \in H_{M_{n}}^{2}$. Since $F_{1}=E \Theta_{2} \in$ $\mathcal{K}_{\Theta_{1} \Theta_{2}}$, it follows that $E \in \mathcal{K}_{\Theta_{1}}$. This proves the inclusion $\mathcal{K}_{\Theta_{1} \Theta_{2}} \subseteq \mathcal{K}_{\Theta_{1}} \Theta_{2}+\mathcal{K}_{\Theta_{2}}$. The reverse inclusion is obvious.

The following lemma shows the pull-back property on the symbols of hyponormal block Toeplitz operators.
Lemma 2.5. Let $\Phi \equiv \Phi_{-}^{*}+\Phi_{+} \in L_{M_{n}}^{\infty}$ be such that $\Phi$ and $\Phi^{*}$ are of bounded type of the form

$$
\Phi_{+}=\Theta \Theta_{1} A^{*} \quad \text { and } \quad \Phi_{-}=\Theta B^{*} \quad\left(\Theta \text { and } \Theta_{1} \text { are inner }\right)
$$

where $\Theta_{1}$ and $A$ are right coprime. Put

$$
\begin{equation*}
\Psi=\Phi_{-}^{*}+\Theta\left(P_{\mathcal{K}_{\Theta}} A_{1}\right)^{*} \tag{2.1}
\end{equation*}
$$

where $A_{1}$ is defined by

$$
\Theta_{1} A^{*}=A_{1}^{*} \Theta_{2}
$$

where $A_{1}$ and $\Theta_{2}$ are left coprime. Then

$$
\begin{equation*}
T_{\Phi} \text { is pseudo-hyponormal } \Longleftrightarrow T_{\Psi} \text { is pseudo-hyponormal. } \tag{2.2}
\end{equation*}
$$

Moreover, if $\Theta_{1}=I_{\theta_{1}}$ for a finite Blaschke product $\theta_{1}$, then in (2.1), $A_{1}$ can be chosen as $A$.
Proof. Suppose $T_{\Phi}$ is pseudo-hyponormal. Then there exists a matrix function $K \in \mathcal{E}(\Phi)$, i.e., $B \Theta^{*}-K A \Theta_{1}^{*} \Theta^{*} \in H_{M_{n}}^{2}$, which implies that $K A \Theta_{1}^{*} \in H_{M_{n}}^{2}$. We thus have

$$
K \Theta_{2}^{*} A_{1} \in H_{M_{n}}^{2}, \text { so that, } A_{1}^{T}\left(\Theta_{2}^{*}\right)^{T} K^{T} \in H_{M_{n}}^{2},
$$

where $(\cdot)^{T}$ means the transpose of the matrix. This implies $H_{A_{1}^{T}\left(\Theta_{2}^{*}\right)^{T}} T_{K^{T}}=0$. We thus have

$$
\begin{equation*}
K^{T} H_{\mathbb{C}^{n}}^{2} \subseteq \operatorname{ker} H_{A_{1}^{T}\left(\Theta_{2}^{T}\right)^{*}}=\Theta_{2}^{T} H_{\mathbb{C}^{n}}^{2} \tag{2.3}
\end{equation*}
$$

where the last equality follows from the observation that $A_{1}^{T}$ and $\Theta_{2}^{T}$ are right coprime because $A_{1}$ and $\Theta_{2}$ are left coprime. Thus (2.3) shows that $\Theta_{2}^{T}$ is a left inner divisor of $K^{T}$, i.e., $K^{T}=\Theta_{2}^{T}\left(K^{\prime}\right)^{T}$ for some $K^{\prime} \in H_{M_{n}}^{2}$, so that $K=K^{\prime} \Theta_{2}$. Thus we have

$$
\begin{aligned}
K \in \mathcal{E}(\Phi) & \Longleftrightarrow B \Theta^{*}-K A \Theta_{1}^{*} \Theta^{*} \in H_{M_{n}}^{2} \\
& \Longleftrightarrow B \Theta^{*}-K \Theta_{2}^{*} A_{1} \Theta^{*} \in H_{M_{n}}^{2} \\
& \Longleftrightarrow B \Theta^{*}-K^{\prime} A_{1} \Theta^{*} \in H_{M_{n}}^{2} .
\end{aligned}
$$

We write

$$
A_{1}^{\prime}:=P_{\mathcal{K}_{\Theta}} A_{1} \quad \text { and } \quad A_{1}^{\prime \prime}:=A-A_{1}^{\prime} \in H_{M_{n}}^{2} \Theta .
$$

We thus have

$$
K \in \mathcal{E}(\Phi) \Longleftrightarrow B \Theta^{*}-K^{\prime}\left(A_{1}^{\prime}+A_{1}^{\prime \prime}\right) \Theta^{*} \in H_{M_{n}}^{2} .
$$

But since $A_{1}^{\prime \prime} \in H_{M_{n}}^{2} \Theta$, and hence $A_{1}^{\prime \prime} \Theta^{*} \in H_{M_{n}}^{2}$, it follows that

$$
K \in \mathcal{E}(\Phi) \Longleftrightarrow B \Theta^{*}-K^{\prime}\left[P_{\mathcal{K}_{\Theta}} A_{1}\right] \Theta^{*} \in H_{M_{n}}^{2} \Longleftrightarrow K^{\prime} \in \mathcal{E}(\Psi),
$$

which gives the result. The second assertion follows at once from the first together with Lemma 2.1.

Lemma 2.5 guarantees that the analytic part of the symbol $\Phi$ can be "pulled back" to a function having the same inner part of the decomposition as that of the co-analytic part without losing the pseudo-hyponormality. However the 'coprime' condition is essential. To see this consider

$$
\Phi:=\left[\begin{array}{cc}
\bar{z}+2 z^{2} & 0 \\
0 & \bar{z}+2 z
\end{array}\right] .
$$

Write

$$
\Theta=\Theta_{1}:=I_{z}, \quad A:=\left[\begin{array}{cc}
2 & 0 \\
0 & 2 z
\end{array}\right], \quad \text { and } \quad B:=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right] .
$$

Then

$$
\Phi_{+}=\Theta \Theta_{1} A^{*} \quad \text { and } \quad \Phi_{-}=\Theta B^{*}
$$

Put

$$
\Psi:=\Theta_{1}\left(P_{\mathcal{K}_{\Theta_{1}}} A\right)^{*}+B \Theta_{1}^{*}=\left[\begin{array}{cc}
\bar{z}+2 z & 0 \\
0 & \bar{z}
\end{array}\right] .
$$

Then $T_{\Phi}$ is pseudo-hyponormal (because if $K:=\left[\begin{array}{cc}\frac{1}{2} z & 0 \\ 0 & \frac{1}{2}\end{array}\right]$ then $\Phi_{-}^{*}-K \Phi_{+}^{*} \in H^{\infty}$ and $\|K\|_{\infty}<1$ ), whereas $T_{\Psi}$ is not (because $T_{\bar{z}}$ is not hyponormal). Note that by Lemma 2.1, $A$ and $\Theta_{1}$ are not right coprime because $A(0)$ is not invertible.

If $\Phi \equiv \Phi_{-}^{*}+\Phi_{+} \in L_{M_{n}}^{\infty}$ is of bounded type of the form

$$
\Phi_{+}=\Theta A^{*} \quad \text { and } \quad \Phi_{-}=\Theta B^{*} \quad(\Theta \text { is inner })
$$

and if $\Theta_{0}$ is a right inner divisor of $\Theta$, we write

$$
\Phi_{\Theta_{0}}:=\left[P_{\mathcal{K}_{\Theta_{0}}} B\right] \Theta_{0}^{*}+\Theta_{0}\left[P_{\mathcal{K}_{\Theta_{0}}} A\right]^{*} .
$$

We then have:
Lemma 2.6. Let $\Phi \equiv \Phi_{-}^{*}+\Phi_{+} \in L_{M_{n}}^{\infty}$ be such that $\Phi$ and $\Phi^{*}$ are of bounded type of the form

$$
\Phi_{+}=\Theta A^{*} \quad \text { and } \quad \Phi_{-}=\Theta B^{*}
$$

where $\Theta$ is inner. If $\Theta_{0}$ is a right inner divisor of $\Theta$, then

$$
\mathcal{E}(\Phi) \subseteq \mathcal{E}\left(\Phi_{\Theta_{0}}\right)
$$

In particular, if $T_{\Phi}$ is pseudo-hyponormal then $T_{\Phi_{\Theta_{0}}}$ is pseudo-hyponormal.
Proof. Let $\Theta=\Theta_{1} \Theta_{0}$ for some inner matrix function $\Theta_{1}$. If $K \in \mathcal{E}(\Phi)$, then $B \Theta^{*}-K A \Theta^{*} \in H_{M_{n}}^{2}$, or equivalently,

$$
B \Theta_{0}^{*}-K A \Theta_{0}^{*} \in H_{M_{n}}^{2} \Theta_{1} .
$$

In view of Lemma 2.4, we can write

$$
A:=P_{\mathcal{K}_{\Theta_{0}}} A+A_{1} \quad \text { and } \quad B:=P_{\mathcal{K}_{\Theta_{0}}} B+B_{1},
$$

where $A_{1}=H_{1} \Theta_{0}$ and $B_{1}=H_{2} \Theta_{0}$ for some $H_{1}, H_{2} \in \mathcal{K}_{\Theta_{1}}$. We thus have

$$
\left(P_{\mathcal{K}_{\Theta_{0}}} B-K P_{\mathcal{K}_{\Theta_{0}}} A\right) \Theta_{0}^{*}+\left(H_{2}-K H_{1}\right) \in H_{M_{n}}^{2} \Theta_{1}
$$

so that

$$
\left[P_{\mathcal{K}_{\Theta_{0}}} B\right] \Theta_{0}^{*}-K\left[P_{\mathcal{K}_{\Theta_{0}}} A\right] \Theta_{0}^{*} \in H_{M_{n}}^{2}
$$

which implies that $K \in \mathcal{E}\left(\Phi_{\Theta_{0}}\right)$. Thus we have that $\mathcal{E}(\Phi) \subseteq \mathcal{E}\left(\Phi_{\Theta_{0}}\right)$, which gives the result.

## 3. Toeplitz operators with matrix-valued circulant symbols

To motivate our interest in the circulant symbols, we recall [FKKL, IC, It] that the characterization of finite normal Toeplitz matrices states that every finite normal Toeplitz matrix whose eigenvalues are not collinear must be a generalized circulant, which is a normal matrix of the form

$$
\left[\begin{array}{ccccc}
a_{0} & e^{i \omega} a_{N} & \ldots & \ldots & e^{i \omega} a_{1} \\
a_{1} & a_{0} & \ddots & & \vdots \\
\vdots & \ddots & \ddots & \ddots & \vdots \\
\vdots & & \ddots & a_{0} & e^{i \omega} a_{N} \\
a_{N} & \ldots & \ldots & a_{1} & a_{0}
\end{array}\right]
$$

We also recall that a trigonometric polynomial $\varphi(z)=\sum_{n=-N}^{N} a_{n} z^{n}$ is called a circulant polynomial if $a_{-k}=e^{i \omega} a_{N-k+1}$ for every $1 \leq k \leq N$ and $\omega \in[0.2 \pi)$, in other words, the compression of $T_{\varphi}$ to $\bigvee\left\{1, z, \ldots, z^{N}\right\}$ is a generalized circulant matrix. In [FL2], the hyponormality of Toeplitz operators with circulant polynomial symbols was completely characterized.

Suppose $\varphi(z)=\sum_{k=-n}^{n} a_{k} z^{k}$ is a circulant polynomial. If $\varphi(0)=0$, then we may write

$$
\varphi=b+e^{i \omega \overline{z^{n+1}} b \in L^{\infty} \quad\left(b \in \mathcal{H}^{0}\left(z^{n+1}\right)\right), ~, ~}
$$

where

$$
\mathcal{H}^{0}(\theta):=\{h \in \mathcal{H}(\theta): h(0)=0\} .
$$

More generally, a function $\varphi \in L^{\infty}$ is called a circulant function if

$$
\varphi=f+\bar{\theta} f \quad\left(\theta \text { is inner, } f \in \mathcal{H}^{0}(\theta)\right)
$$

We introduce:
Definition 3.1. For $\Phi \in L_{M_{n}}^{\infty}$, $\Phi$ is called a (matrix-valued) circulant function if

$$
\Phi=A+\Theta^{*} A
$$

where $\Theta:=I_{\theta}$ for an inner function $\theta, A \in \mathcal{K}_{\Theta}^{0} \equiv\left\{B \in \mathcal{K}_{\Theta}: B(0)=0\right\}$, and $\operatorname{det} A$ is not identically zero.

On the other hand, if

$$
\Phi=\left[\begin{array}{ccc}
\varphi_{11} & \ldots & \varphi_{1 n} \\
& \vdots & \\
\varphi_{n 1} & \ldots & \varphi_{n n}
\end{array}\right] \in L_{M_{n}}^{\infty}
$$

then $\Phi$ is a circulant function if and only if each $\varphi_{i j}$ is a circulant function of the form

$$
\varphi_{i j}=f_{i j}+\bar{\theta} f_{i j} \quad\left(f_{i j} \in \mathcal{H}^{0}(\theta)\right)
$$

Since $A \in \mathcal{K}_{\Theta}^{0}$ we have that $\Phi_{+}=A$ and $\Phi_{-}^{*}=\Theta^{*} A$. In particular, if $\Phi$ is a circulant function then $\Phi^{*}$ is of bounded type because $\Phi_{-}=\Theta A^{*} \in H_{M_{n}}^{2}$, so that $A^{*}=\Theta^{*} \Phi_{-}$and $\Phi^{*}=A^{*}+\Theta A^{*}=$ $\Theta^{*} \Phi_{-}+\Phi_{-}=\Theta^{*}\left(\Phi_{-}+\Theta \Phi_{-}\right)$.

The authors of [GHR] characterized the hyponormality of $T_{\Phi}$ with symbol $\Phi$ satisfying $\left\|\Phi_{+}\right\|_{2}=\left\|\Phi_{-}\right\|_{2}$ : for given $\Phi=\Phi_{+}+\Phi_{-}^{*} \in L_{M_{n}}^{\infty}$, if $\left\|\Phi_{+}\right\|_{2}=\left\|\Phi_{-}\right\|_{2}$ and $\operatorname{det} \Phi_{+}$is not identically zero, then $T_{\Phi}$ is hyponormal if and only if $\Phi^{*} \Phi=\Phi \Phi^{*}$ and $\Phi_{+}=\Phi_{-} K$ for some inner matrix function $K \in H_{M_{n}}^{\infty}$.

The following lemma says that the hyponormality and the pseudo-hyponormality coincide for the cases of circulant symbols.

Lemma 3.2. Let $\Psi=A+\Theta^{*} A \in L_{M_{n}}^{\infty}$ be a circulant function. Then the following statements are equivalent:
(a) $T_{\Psi}$ is hyponormal;
(b) $T_{\Psi}$ is pseudo-hyponormal;
(c) $K:=\left(A^{*}\right)^{-1} \Theta^{*} A$ is the only inner matrix function in $\mathcal{E}(\Psi)$.

Proof. (a) $\Rightarrow$ (b): Obvious.
(b) $\Rightarrow$ (c): Suppose $T_{\Psi}$ is pseudo-hyponormal. Since

$$
\left\|\Psi_{-}\right\|_{2}^{2}=\int_{\mathbb{T}} \operatorname{tr}\left[\left(\Theta A^{*}\right)^{*} \Theta A^{*}\right] d \mu=\int_{\mathbb{T}} \operatorname{tr} A A^{*} d \mu=\left\|\Psi_{+}\right\|_{2}^{2}
$$

it follows from the preceding remark that there exists an inner matrix function $K \in H_{M_{n}}^{\infty}$ such that $A=A^{*} \Theta K$. Thus $K=\left(A^{*}\right)^{-1} \Theta^{*} A$ because $\Theta=I_{\theta}$.
(c) $\Rightarrow(\mathrm{a})$ : Suppose $K:=\left(A^{*}\right)^{-1} \Theta^{*} A$ is an inner matrix function in $\mathcal{E}(\Psi)$. Then $T_{\Psi}$ is pseudohyponormal and $A=A^{*} \Theta K$ because $\Theta=I_{\theta}$. Since $K$ is an inner matrix, it follows that

$$
A A^{*}=A^{*} \Theta K K^{*} \Theta^{*} A=A^{*} A
$$

which implies that $A$ is normal, and hence $\Psi$ is also normal. Therefore $T_{\Psi}$ is hyponormal.
We are ready to prove the main theorem, which is a kind of the extension property of the symbol. It provides a necessary and sufficient condition for the symbol of a hyponormal Toeplitz operators with circulant symbols to be pulled up without losing the hyponormality.
Theorem 3.3. Let $\Psi=A+\Theta^{*} A \in L_{M_{n}}^{\infty}$ be a circulant function and let $\Phi=\Phi_{-}^{*}+\Phi_{+} \in L_{M_{n}}^{\infty}$ be of the form

$$
\Phi_{+}:=A \Theta_{0}+B \quad \text { and } \quad \Phi_{-}:=\Theta A^{*} \Theta_{0}+C,
$$

where $\Theta_{0}=I_{\theta_{0}}$ for an inner function $\theta_{0}$ and $B, C \in \mathcal{K}_{I_{z} \Theta_{0}}$. Then

$$
T_{\Phi} \text { is pseudo-hyponormal } \Longleftrightarrow\left(A^{*}\right)^{-1} \Theta^{*} A \in \mathcal{E}\left(C^{*}+B\right) .
$$

Moreover, if $T_{\Phi}$ is hyponormal then the rank of the self-commutator of $T_{\Phi}$ is computed from the formula

$$
\begin{equation*}
\operatorname{rank}\left[T_{\Phi}^{*}, T_{\Phi}\right]=\operatorname{deg}\left[\operatorname{det}\left(\left(A^{*}\right)^{-1} \Theta^{*} A\right)\right] \tag{3.1}
\end{equation*}
$$

where $\operatorname{deg}(k)$ denotes the degree of $k$ - meaning the number of zeros of $k$ (in the open unit disk $\mathbb{D}$ ) if $k$ is a finite Blaschke product and $\infty$ otherwise.

Proof. Suppose $T_{\Phi}$ is pseudo-hyponormal. Since $\Theta=I_{\theta}$, we know that

$$
\begin{aligned}
& \Phi_{+}:=A \Theta_{0}+B=\left(A \Theta^{*}+B \Theta^{*} \Theta_{0}^{*}\right) \Theta_{0} \Theta=\left(\Theta A^{*}+\Theta_{0} \Theta B^{*}\right)^{*} \Theta_{0} \Theta \\
& \Phi_{-}:=\Theta A^{*} \Theta_{0}+C=\left(A+\Theta_{0} \Theta C^{*}\right)^{*} \Theta_{0} \Theta
\end{aligned}
$$

Thus it follows that

$$
\Phi_{\Theta}=\Theta\left[P_{\mathcal{K}_{\Theta}}\left(\Theta A^{*}+\Theta \Theta_{0} B^{*}\right)\right]^{*}+\left[P_{\mathcal{K}_{\Theta}}\left(A+\Theta \Theta_{0} C^{*}\right)\right] \Theta^{*}
$$

But since $B \in \mathcal{K}_{I_{z} \Theta_{0}}$, we have that $\left\langle B, H_{M_{n}}^{2} I_{z} \Theta_{0}\right\rangle=0$. Thus $B \Theta_{0}^{*} \in L_{M_{n}}^{2} \ominus H_{M_{n}}^{2} I_{z}$, and hence $\Theta_{0} B^{*} \in H_{M_{n}}^{2}$ and similarly, $\Theta_{0} C^{*} \in H_{M_{n}}^{2}$. This implies that $P_{\mathcal{K}_{\Theta}}\left(\Theta \Theta_{0} B^{*}\right)=0=P_{\mathcal{K}_{\Theta}}\left(\Theta \Theta_{0} C^{*}\right)$, so that

$$
\Phi_{\Theta}=\Theta\left[P_{\mathcal{K}_{\Theta}}\left(\Theta A^{*}\right)\right]^{*}+\left[P_{\mathcal{K}_{\Theta}}(A)\right] \Theta^{*}=\Theta\left(\Theta A^{*}\right)^{*}+A \Theta^{*}=A+\Theta^{*} A=\Psi .
$$

By Lemma 2.6, $T_{\Psi}$ is pseudo-hyponormal and $\mathcal{E}(\Phi) \subseteq \mathcal{E}(\Psi)$. By Lemma 3.2, $K:=\left(A^{*}\right)^{-1} \Theta^{*} A$ is the only inner function in $\mathcal{E}(\Psi)$. Since $\mathcal{E}(\Phi) \subseteq \mathcal{E}(\Psi)$ and $\mathcal{E}(\Psi)$ is a singleton set, it follows that $\mathcal{E}(\Phi)=\{K\}$, so that

$$
\begin{align*}
\Phi_{-}^{*}-K \Phi_{+}^{*} & =\Theta_{0}^{*} A \Theta^{*}+C^{*}-K\left(\Theta_{0}^{*} A^{*}+B^{*}\right) \\
& =\left(\Theta_{0}^{*} A-\left(A^{*}\right)^{-1} A \Theta_{0}^{*} A^{*}\right) \Theta^{*}+\left(C^{*}-\left(A^{*}\right)^{-1} \Theta^{*} A B^{*}\right) \in H_{M_{n}}^{2} . \tag{3.2}
\end{align*}
$$

Since $\Theta_{0}=I_{\theta_{0}}$, (3.2) reduces to $C^{*}-\left(A^{*}\right)^{-1} \Theta^{*} A B^{*} \in H_{M_{n}}^{2}$ because $A$ is normal. But since $K=\left(A^{*}\right)^{-1} \Theta^{*} A$ is an inner function, it follows that $\left(A^{*}\right)^{-1} \Theta^{*} A \in \mathcal{E}\left(C^{*}+B\right)$. The converse is evident from (3.2).

Towards the rank formula (3.1), suppose that $T_{\Phi}$ is hyponormal. Since $K \equiv\left(A^{*}\right)^{-1} \Theta^{*} A \in$ $\mathcal{E}\left(C^{*}+B\right)$, it follows that for some $F \in H_{M_{n}}^{2}$,

$$
\begin{equation*}
C^{*}-K B^{*}=F, \quad \text { i.e., } \quad B=C K-F^{*} K . \tag{3.3}
\end{equation*}
$$

We thus have

$$
\begin{equation*}
\Phi_{+}=\Phi_{-} K-F^{*} K, \quad \text { or equivalently, } \quad \Phi_{-}=\Phi_{+} K^{*}+F^{*} . \tag{3.4}
\end{equation*}
$$

Observe by (1.6),

$$
\begin{equation*}
\left[T_{\Phi}^{*}, T_{\Phi}\right]=H_{\Phi_{+}^{*}}^{*} H_{\Phi_{+}^{*}}-H_{\Phi_{-}^{*}}^{*} H_{\Phi_{-}^{*}}=H_{\Phi_{+}^{*}}^{*} H_{\Phi_{+}^{*}}-H_{K \Phi_{+}^{*}}^{*} H_{K \Phi_{+}^{*}}=H_{\Phi_{+}^{*}}^{*} H_{K^{*}} H_{K^{*}}^{*} H_{\Phi_{+}^{*}} . \tag{3.5}
\end{equation*}
$$

We now claim that

$$
\begin{equation*}
\operatorname{ker} H_{\Phi_{+}^{*}}^{*} H_{K^{*}}=\operatorname{ker} H_{K^{*}} \tag{3.6}
\end{equation*}
$$

Towards (3.6), let $g \in \operatorname{ker} H_{\Phi_{+}^{*}}^{*} H_{K^{*}}$. We write

$$
g=g_{1}+K g_{2} \quad \text { where } g_{1} \in \mathcal{H}(K) \text { and } g_{2} \in H_{\mathbb{C}^{n}}^{2}
$$

We then have

$$
\begin{aligned}
H_{\Phi_{+}^{*}}^{*} H_{K^{*}} g & =H_{\Phi_{+}^{*}}^{*} J P_{n}^{\perp}\left(K^{*}\left(g_{1}+K g_{2}\right)\right) \\
& =H_{\Phi_{+}^{*}}^{*} J\left(K^{*} g_{1}\right) \\
& =J P_{n}^{\perp}\left(\widetilde{\Phi}_{+}^{*}(z) I_{\bar{z}} K^{*}(\bar{z}) g_{1}(\bar{z})\right) \\
& =J P_{n}^{\perp}\left[\left(\Phi_{-}(\bar{z}) K(\bar{z})-F^{*}(\bar{z}) K(\bar{z})\right) I_{\bar{z}} K^{*}(\bar{z}) g_{1}(\bar{z})\right] \quad(\text { by }(3.4)) \\
& =J P_{n}^{\perp}\left[\left(\Phi_{-}(\bar{z})-C(\bar{z})+B(\bar{z}) K^{*}(\bar{z})\right) I_{\bar{z}} g_{1}(\bar{z})\right] \quad(\text { by }(3.3)) \\
& =P_{n} J\left(I_{\bar{z}}\left(\Theta A^{*} \Theta_{0}\right)(\bar{z}) g_{1}(\bar{z})+B(\bar{z}) K^{*}(\bar{z}) I_{\bar{z}} g_{1}(\bar{z})\right) \quad\left(\text { because } J P_{n}^{\perp}=P_{n} J\right) \\
& =P_{n}\left(I_{\bar{z}} I_{z} \Theta A^{*} \Theta_{0} g_{1}+I_{\bar{z}} B K^{*} I_{z} g_{1}\right) \\
& =\Theta A^{*} \Theta_{0} g_{1}+P_{n}\left(B K^{*} g_{1}\right) .
\end{aligned}
$$

But since $K^{*} g_{1}$ is co-analytic and $B \in \mathcal{K}_{I_{z} \Theta_{0}}$, it follows that $B K^{*} g_{1} \in L_{C^{n}}^{2} \ominus \Theta_{0} H_{C^{n}}^{2}$ : indeed, for any $d \in H_{C^{n}}^{2}$,

$$
\left\langle B K^{*} g_{1}, \Theta_{0} d\right\rangle=\left\langle\left(\Theta_{0}^{*} B\right)\left(K^{*} g_{1}\right), d\right\rangle=0
$$

Therefore we have that $P_{n}\left(B K^{*} g_{1}\right) \in \mathcal{H}\left(\Theta_{0}\right)$. Since $\Theta A^{*} \Theta_{0} g_{1} \in \Theta_{0} H_{C^{n}}^{2}$, it follows from (3.7) that $H_{\Phi_{+}^{*}}^{*} H_{K^{*}} g$ cannot be zero unless $g_{1}=0$, which says that $g \in \operatorname{ker} H_{\Phi_{+}^{*}}^{*} H_{K^{*}}$ only if $g=K g_{2}$. Consequently, $\operatorname{ker} H_{\Phi_{+}^{*}}^{*} H_{K^{*}} \subseteq \operatorname{ker} H_{K^{*}}$, which proves (3.6). Thus by (3.5) and (3.6),

$$
\begin{aligned}
\operatorname{rank}\left[T_{\Phi}^{*}, T_{\Phi}\right] & =\operatorname{rank}\left(H_{\Phi_{+}^{*}}^{*} H_{K^{*}}\right) \\
& =\operatorname{dim}\left(H_{\mathbb{C}^{n}}^{2} \ominus \operatorname{ker} H_{\Phi_{+}^{*}}^{*} H_{K^{*}}\right) \\
& =\operatorname{dim}\left(H_{\mathbb{C}^{n}}^{2} \ominus \operatorname{ker} H_{K^{*}}\right) \\
& =\operatorname{dim}\left(H_{\mathbb{C}^{n}}^{2} \ominus K H_{\mathbb{C}^{n}}^{2}\right) \\
& =\operatorname{deg}(\operatorname{det} K),
\end{aligned}
$$

where the last equality comes from the following observation:

$$
\begin{aligned}
\operatorname{dim}\left(H_{\mathbb{C}^{n}}^{2} \ominus K H_{\mathbb{C}^{n}}^{2}\right) & =\operatorname{dim} \operatorname{ker} T_{K^{*}}=-\operatorname{index} T_{K}=-\operatorname{index} T_{\operatorname{det} K} \\
& =\operatorname{dim} \operatorname{ker} T \overline{\overline{\operatorname{det} K}}=\operatorname{dim} \mathcal{H}(\operatorname{det} K) \\
& =\operatorname{deg}(\operatorname{det} K)
\end{aligned}
$$

where the third equality comes from the well-known Fredholm theory of block Toeplitz operators since $\operatorname{det} K \neq 0$ (cf. [Pe, Theorem 3.4.8]). This proves the theorem.

We give a revealing example.
Example 3.4. Let $a_{j}, b_{j} \in \mathbb{C}$ for $j=1,2$ and consider the matrix-valued trigonometric polynomial

$$
\Phi \equiv\left[\begin{array}{cc}
z^{-2}+z^{-1}-z+z^{2} & -2 z^{-2}+b_{1} z^{-1}+a_{1} z-2 z^{2} \\
2 z^{-2}+b_{2} z^{-1}+a_{2} z+2 z^{2} & z^{-2}+z^{-1}-z+z^{2}
\end{array}\right]
$$

Write

$$
\Phi_{0} \equiv \Phi_{I_{z}}=\left[\begin{array}{cc}
z^{-1}+z & -2 z^{-1}-2 z \\
2 z^{-1}+2 z & z^{-1}+z
\end{array}\right]=\left[\begin{array}{cc}
z & -2 z \\
2 z & z
\end{array}\right]+\left[\begin{array}{cc}
z^{2} & 0 \\
0 & z^{2}
\end{array}\right]^{*}\left[\begin{array}{cc}
z & -2 z \\
2 z & z
\end{array}\right]
$$

Evidently, $\Phi_{0}$ is a circulant function and $T_{\Phi_{0}}$ is normal. Write

$$
A:=\left[\begin{array}{cc}
z & -2 z \\
2 z & z
\end{array}\right], \quad \Theta:=I_{z^{2}}, \quad B:=\left[\begin{array}{cc}
-z & a_{1} z \\
a_{2} z & -z
\end{array}\right], \quad C:=\left[\begin{array}{cc}
z & \overline{b_{2}} z \\
\overline{b_{1}} z & z
\end{array}\right] .
$$

By Theorem 3.3, we know that

$$
T_{\Phi} \text { is pseudo-hyponormal } \Longleftrightarrow\left(A^{*}\right)^{-1} \Theta^{*} A \in \mathcal{E}\left(C^{*}+B\right)
$$

Observe that

$$
\begin{aligned}
\left(A^{*}\right)^{-1} \Theta^{*} A & =\left[\begin{array}{cc}
\bar{z} & 2 \bar{z} \\
-2 \bar{z} & \bar{z}
\end{array}\right]^{-1} I_{z^{-2}}\left[\begin{array}{cc}
z & -2 z \\
2 z & z
\end{array}\right] \\
& =\frac{1}{5}\left[\begin{array}{cc}
-3 & -4 \\
4 & -3
\end{array}\right]
\end{aligned}
$$

Thus $T_{\Phi}$ is pseudo-hyponormal if and only if

$$
\left[\begin{array}{cc}
z^{-1} & b_{1} z^{-1} \\
b_{2} z^{-1} & z^{-1}
\end{array}\right]-\frac{1}{5}\left[\begin{array}{cc}
-3 & -4 \\
4 & -3
\end{array}\right]\left[\begin{array}{cc}
-z^{-1} & \overline{a_{2}} z^{-1} \\
\overline{a_{1}} z^{-1} & -z^{-1}
\end{array}\right] \in H_{M_{n}}^{2}
$$

or equivalently,

$$
\left\{\begin{array}{l}
z^{-1}-\left(\frac{3}{5} z^{-1}-\frac{4}{5} \overline{a_{1}} z^{-1}\right) \in H^{2} \\
b_{1} z^{-1}-\left(-\frac{3}{5} \overline{a_{2}} z^{-1}+\frac{4}{5} z^{-1}\right) \in H^{2} \\
b_{2} z^{-1}-\left(-\frac{4}{5} z^{-1}-\frac{3}{5} \overline{a_{1}} z^{-1}\right) \in H^{2} \\
z^{-1}-\left(\frac{4}{5} \overline{a_{2}} z^{-1}+\frac{3}{5} z^{-1}\right) \in H^{2},
\end{array}\right.
$$

or equivalently,

$$
a_{1}=-\frac{1}{2}, \quad a_{2}=\frac{1}{2}, \quad b_{1}=\frac{1}{2}, \quad b_{2}=-\frac{1}{2} .
$$

In fact, in this case, a straightforward calculation shows that $T_{\Phi}$ is normal.
The next corollary gives a nice rank formula for the self-commutators of $T_{\Phi}$ if the symbol $\Phi$ is a circulant polynomial.

Corollary 3.5. Let $\Phi \in L_{M_{n}}^{\infty}$ be a matrix-valued circulant polynomial of the form

$$
\Phi(z):=\sum_{j=-r}^{r} A_{j} z^{j} \equiv \Theta^{*} A+A
$$

where $\Theta=I_{\theta}$ with $\theta:=e^{i \xi} z^{r+1}$ for some $\xi \in \mathbb{R}$ and let $F$ denote the analytic matrix polynomial

$$
F(z):=\sum_{j=1}^{r} A_{j} z^{j-1}
$$

If $T_{\Phi}$ is pseudo-hyponormal then for every zero $\zeta$ of $\operatorname{det} F$ such that $|\zeta|>1$, the number $1 / \bar{\zeta}$ is a zero of $\operatorname{det} F$ in $\mathbb{D}$ of multiplicity greater than or equal to the multiplicity of $\zeta$. Moreover, if $T_{\Phi}$ is hyponormal then the rank of the self-commutator of $T_{\Phi}$ is given by

$$
\begin{equation*}
\operatorname{rank}\left[T_{\Phi}^{*}, T_{\Phi}\right]=Z_{\mathbb{D}}-Z_{\mathbb{C} \backslash \overline{\mathbb{D}}}-(n(r-1)-\operatorname{deg}(\operatorname{det} F)) \tag{3.8}
\end{equation*}
$$

where $Z_{\mathbb{D}}$ and $Z_{\mathbb{C} \backslash \overline{\mathbb{D}}}$ are the number of zeros of $\operatorname{det} F$ in $\mathbb{D}$ and in $\mathbb{C} \backslash \overline{\mathbb{D}}$ counting multiplicity. In particular, if the analytic outer coefficient $A_{r}$ is invertible then

$$
\begin{equation*}
\operatorname{rank}\left[T_{\Phi}^{*}, T_{\Phi}\right]=Z_{\mathbb{D}}-Z_{\mathbb{C} \backslash \overline{\mathbb{D}}} \tag{3.9}
\end{equation*}
$$

Proof. Note that $A(z):=\sum_{j=1}^{r} A_{j} z^{j}$. If $T_{\Phi}$ is pseudo-hyponormal then by Lemma $3.2, K \equiv$ $\left(A^{*}\right)^{-1} \Theta^{*} A$ is the only inner matrix function in $\mathcal{E}(\Phi)$. Thus $\operatorname{det} K=\operatorname{det} A(\operatorname{det} \Theta \overline{\operatorname{det} A})^{-1}$ is a scalar-valued inner function. Observe

$$
\begin{equation*}
\operatorname{det} K=\frac{\operatorname{det} A}{\operatorname{det} \Theta \overline{\operatorname{det} A}}=\frac{z^{n} \operatorname{det} F}{e^{i n \xi} z^{n(r+1)} \overline{z^{n} \operatorname{det} F}}=e^{-i n \xi} \frac{\operatorname{det} F}{z^{n(r-1)} \overline{\operatorname{det} F}} . \tag{3.10}
\end{equation*}
$$

Since $\operatorname{det} K$ is inner and $\operatorname{det} F$ is a polynomial it follows that $\operatorname{det} K$ is a finite Blaschke product. Therefore for every zero $\zeta$ of $\operatorname{det} F$ such that $|\zeta|>1$, the number $1 / \bar{\zeta}$ is a zero of $\operatorname{det} F$ in $\mathbb{D}$ of multiplicity greater than or equal to the multiplicity of $\zeta$. Towards (3.8) suppose that $T_{\Phi}$ is hyponormal. If $\operatorname{deg}(\operatorname{det} F)=m \leq n(r-1)$, then we can write

$$
\operatorname{det} K=e^{-i n \xi} \frac{z^{p} \prod_{j=1}^{m-p}\left(z-\alpha_{j}\right)}{z^{n(r-1)} z^{-m} \prod_{j=1}^{m-p}\left(1-\overline{\alpha_{j}} z\right)} \quad\left(\alpha_{j} \neq 0\right)
$$

Since $\operatorname{det} K$ is a finite Blaschke product it follows that $n(r-1)-m \leq p$ and

$$
\operatorname{deg}(\operatorname{det} K)=Z_{\mathbb{D}}-Z_{\mathbb{C} \backslash \overline{\mathbb{D}}}-(n(r-1)-m)
$$

Thus the formula (3.8) follows from Theorem 3.3. On the other hand, if $A_{r}$ is invertible then $m=n(r-1)$, which together with (3.8) gives (3.9).
